

Abstract

The present invention provides a method for making ready-made shoes fitting individuals' foot shapes. This method includes the steps of forming a separate forefoot part and a separate rearfoot part, and connecting them detachably by means of a connecting means to form a shoe body. This makes it possible to easily produce sorts of shoes of different widths for each size by forming forefoot parts of different widths and/or rearfoot parts of different widths, selecting any of these parts of different widths and connecting the forefoot and rearfoot parts. This also makes it possible to easily produce sorts of shoes each pair of which has different sizes and/or widths, by forming forefoot parts of different sizes and/or widths and/or rearfoot parts of different sizes and/or widths, selecting any of these parts of different sizes and/or widths and connecting the forefoot and rearfoot parts.
